AB The present invention is directed to a method of producing recombinant viral vectors at high titers incorporating a variety of important advancements over the art. The method of the present invention incorporates multiple features which provide enhanced prodn. of viruses, particularly those viruses encoding exogenous transgenes. The specifically illustrated method describes a method for the high titer serum-free media prodn. of recombinant replication defective adenoviruses contg. an exogenous transgene. The invention provides methods of prepg. microcarriers, methods for seeding bioreactors at high cell d., increasing the infectivity of the producer cells to the virus, methods to increase product yield through synchronization of the cell cycle of the producer cells, and methods to minimize the deleterious effects of exogenous transgenes. The invention further provides producer cells prepd. by the process of the invention. The invention further provides viruses produced by the process.

AB This invention provides tandem fluorescent protein construct including a donor fluorescent protein moiety, an acceptor fluorescent protein moiety and a linker moiety that couples the donor and acceptor moieties. The donor and acceptor moieties exhibit fluorescence resonance energy transfer which is eliminated upon cleavage. The constructs are useful in enzymic assays. Mutant green fluorescent proteins (GFPs) were created by mutagenesis of the Aequorea victoria GFP. Polyhistidine tagged tandem green and blue fluorescent proteins were recombinantly constructed having an inserted peptide sequence including cleavage recognition sites for many proteases. Cleavage expts. were done with trypsin, enterokinase and ***calpain*** .

AB Ricin precursors with the ricin A and B chains linked by a protease-labile linker peptide are described for use in the treatment of disease. The linker peptide contains a cleavage site for a disease specific protease such as a cancer, fungal, viral or parasitic protease. The ricin A chain may be replaced by comparable cytotoxic proteins such as the abrin A chain. The protein is delivered to the target tissue using viral vectors carrying an expression cassette for the ricin fusion protein gene. Construction of a series of variants of preproricin cleavable by a no. of different proteinases is described. Cleavage and activation of these variants with the expected patterns of cleavage of rRNA is demonstrated.

AB The present invention provides a protein having an A chain of a ricin-like toxin, a B chain of a ricin-like toxin and a heterologous linker amino acid sequence, linking the A and B chains. The linker sequence contains a cleavage recognition site for a disease specific protease such as a cancer, fungal, viral or parasitic protease. The invention also relates to a nucleic acid molecule encoding the protein and to expression vectors incorporating the nucleic acid molecule. Also provided is a method of inhibiting or destroying mammalian cancer cells, cells infected with a virus, a fungus, or parasite, or parasites utilizing the nucleic acid molecules and proteins of the invention and pharmaceutical compositions for treating human cancer, viral infection, fungal infection, or parasitic infection.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

S INDEXING IS AVAILABLE FOR THIS PATENT.

A method and a product for cleaning and/or whitening of teeth. Natural human cysteine proteinases are employed for cleaning and whitening purposes and this activity can be blocked by natural cysteine protease inhibitors, which are released secondarily from the product at a later stage. The use of natural cysteine proteinases and their inhibitors provides the advantage that they are man's own proteins, and therefore the risk of allegorization is minimized. In addition, their enzyme kinetics are will known.

S INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention is directed to a method of producing recombinant viral vectors at high titers incorporating a variety of important advancements over the art. The method of the present invention incorporates multiple features which provide enhanced production of viruses, particularly those viruses encoding exogenous transgenes. The specifically illustrated method describes a method for the high titer serum-free media production of recombinant replication defective adenoviruses containing an exogenous transgene. The invention provides methods of preparing microcarriers, methods for seeding bioreactors at high cell density, increasing the infectivity of the producer cells to the virus, methods to increase product yield through synchronization of the cell cycle of the producer cells, and methods to minimize the deleterious effects of exogenous transgenes. The invention further provides producer cells prepared by the process of the invention. The invention further provides viruses produced by the process.

AB A method for identifying oligomer sequences, optionally comprising modified base, which specifically bind target molecules such as serum proteins, kinins, eicosanoids and extracellular proteins is described.

PDGF, FGF, ICAM, VCAM, E-selectin, thrombin, bradykinin, PGF2 and cell surface molecules. The technique involves complexation of the target molecule with a mixture of oligonucleotides containing random sequences and sequences which serve as primer for PCR under conditions wherein a complex is formed with the specifically binding sequences, but not with the other members of the oligonucleotide mixture. The complex is then separated from uncomplexed oligonucleotides and the complexed members of the oligonucleotide mixture are recovered from the separated complex using the polymerase chain reaction. The recovered oligonucleotides may be sequenced, and successive rounds of selection using complexation, separation, amplification and recovery can be employed. The oligonucleotides can be used for therapeutic and diagnostic purposes and for generating secondary aptamers.

AB A polyprotein cleavage assay has been developed to assay the proteolytic activities in vitro of the 2A proteinases encoded by poliovirus and human rhinovirus 14, which are representative members of the Enterovirus and Rhinovirus genera of picornaviruses, respectively. The elastase-specific substrate-based inhibitors elastatinal and methoxysuccinyl-Ala-Ala-Pro-Val-chloromethylketone (MPCMK) inhibited both 2A proteinases in vitro. The

incubation with elastatinal, whereas the mobility of a Cys-109 fwdarw -Ala poliovirus 2A-pro mutant was unchanged, an observation suggesting that this inhibitor may have formed a covalent bond with the active-site Cys-109 nucleophile. Iodoacetamide, ***calpain*** inhibitor 1, and antipain inhibited poliovirus 2A-pro. MPCMK caused a reduction in the yields of the enteroviruses poliovirus type 1 and coxsackievirus A21 and of human rhinovirus 2 in infected HeLa cells but did not affect the growth of encephalomyocarditis virus, a picornavirus of the Cardiovirus genus. MPCMK abrogated the shutoff of host cell protein synthesis that is induced by enterovirus and rhinovirus infection and reduced the synthesis of virus-encoded polypeptides in infected cells. These results indicate that the determinants of substrate recognition by 2A proteinases resemble those of pancreatic and leukocyte elastases. These results may be relevant to the development of broad-range chemotherapeutic agents against entero- and rhinoviruses.

B This invention provides tandem fluorescent protein construct including a donor fluorescent protein moiety, an acceptor fluorescent protein moiety and a linker moiety that couples the donor and acceptor moieties. The donor and acceptor moieties exhibit fluorescence resonance energy transfer which is eliminated upon cleavage. The constructs are useful in enzymic assays. Mutant green fluorescent proteins (GFPs) were created by mutagenesis of the Aequorea victoria GFP. Polyhistidine tagged tandem green and blue fluorescent proteins were recombinantly constructed having an inserted peptide sequence including cleavage recognition sites for many proteases. Cleavage expts. were done with trypsin, enterokinase and ***calpain*** .

SUMM . . . (Proc. Natl. Acad. Sci. USA 88:107973-10800 (1991)) has described a series of viral proteases which are specifically associated

virus, varicella zoster virus-I. and infectious laryngotracheitis virus. These proteases possess similar substrate specificity and play an. . .

SUMM . . . breast cancer, prostate cancer, non small cell lung cancer, malaria, and diverse viral disease states associated with infection with human ***cytomegalovirus*** , hepatitis virus, herpes virus, human rhinovirus, infectious laryngotracheitis virus, poliomyelitis virus, or varicella zoster virus.

SUMM . . . SLSALLSSDIFN cleaved by human prostate-specific antigen; SLPRFKIIGGFN cleaved by kallikrein (bK3): SLLGIAVPGNFN cleaved by neutrophil elastase; and FFKNIVTPRTPP cleaved by ***calpain*** (calcium activated neutral protease). The nucleic acid sequences for ricin A and B chains with each of the linker sequences. . .

SUMM . . . serine, asparagine or valine. In particular embodiments, the linker amino acid sequence comprises SGVVNASCRLAN or SSYVKASVSPEN cleaved by a human ***cytomegalovirus*** protease; SALVNASSAHVN or STYLQASEKFKN cleaved by a ***herpes*** ***simplex*** 1 virus protease; SSILNASVPNFN cleaved by a human herpes virus 6 protease; SQDVNAVEASSN or SVYLQASTGYGN cleaved by a varicella zoster. . .

SUMM . . . In a particular embodiment, the cancer is T-cell or B-cell lymphoproliferative disease. In another particular embodiment, the virus is human ***cytomegalovirus*** , Epstein-Barr virus, hepatitis virus, herpes virus, human rhinovirus, infectious laryngotracheitis virus, poliomyelitis virus, or varicella zoster virus. In a further. . .

SUMM . . . cell carcinoma, gastrointestinal cancer, breast cancer, prostate cancer, non small cell lung cancer. In another embodiment, the virus is human ***cytomegalovirus*** , Epstein-Barr virus, hepatitis virus, herpes virus, human rhinovirus, human T-cell leukemia virus, infectious laryngotracheitis virus, poliomyelitis virus, or varicella zoster. . .

DRWD FIG. 47B shows the nucleotide sequence of the ***calpain*** linker region of pAP-296;

DRWD FIG. 47D shows the amino acid sequence comparison of mutant preproricin linker region of ***calpain*** to wild type;

DRWD FIG. 64 is a blot showing cleavage of pAP-296 with ***calpain*** .

DETD The nucleotide sequence of the ***calpain*** linker region of pAP-296 is referred to herein as SEQ ID NO. 124.

DETD The amino acid sequence of the mutant preproricin linker region for ***calpain*** , pAP-296, is referred to herein as SEQ ID NO. 126.

DETD In a further embodiment, the preparation of proteases from human ***cytomegalovirus*** , human herpes virus, varicalla zoster virus and infectious laryngotracheitis virus have been taught by Liu F. & Roizman, B. (J.. . .

DETD . . . for directing expression in mammalian cells generally include a promoter (e.g., derived from viral material such as polyoma, Adenovirus 2, ***cytomegalovirus*** and Simian Virus 40), as well as other transcriptional and translational control sequences. Examples of mammalian expression vectors include pCDM8. . .

DETD Cleavage of pAP-248 Protein with the Human ***Cytomegalovirus*** (HCMV) Protease

DETD Cleavage of pAP-296 Protein with ***Calpain***

DETD . . . disease-specific proteases to confirm specific cleavage in the linker region. The pAP-296 protein sample (2.05 ug) was digested with the ***Calpain*** protease (10 ug) overnight at 37.degree. C. The total volume of the digestion reaction was 35 ul and 0.761 ug of the reaction sample was loaded on a protein gel. The ***Calpain*** protease was purchased from Sigma Chemical Co., USA

DETD . . . 58 & 66(MMP-2), 60, 64 and 62 show the cleavage of proteases of linkers by HCMV, HAV 3C, MMP-2, t-PA, ***calpain*** , and human neutraphil elastase respectively. Without protease digestion, the proricin variants appear as a single band at approximately 60 kDA. . .

DETD . . . HCMV; pAP-256 by HAV3C protease; pAP-270 by MMP-2 protease; pAP-288 by t-PA protease; pAP-294 by human neutrophil elastase; pAP-296 by ***calpain*** ; and pAP-222 by MMP-2 is illustrated in FIGS. 52, 55, 59, 61, 63, 65, and 67 respectively. The appearance of. . .

DETD . . . Val Pro Gly Asn Phe Asn

ETD . . . Science 244:1288-1292; Capecchi, 1989, Trends in Genet. 5:70-76). Utilizing the PNS method, nonhomologous recombinants are selected against by using the ***Herpes*** ***Simplex*** virus thymidine kinase (HSV-TK) gene and selecting against its nonhomologous insertion with herpes drugs such as gancyclovir or FIAU. By. . .
ETD . . . is notable that another genetic disorder (limb-girdle muscular dystrophy Type 2A) caused by the deficiency of a neutral cysteine protease, ***calpain*** 3, was recently identified in which presumably related families on a small island had different mutations (Richard, I et al., 1995, Cell 81:27-40). ***Calpain*** 3 belongs to a family of calpains, analogous to the cathepsin family. The finding of multiple mutations in ***Calpain*** 3 suggested to Richard et al. that a "digenic" model in which only in the presence of specific alleles at a permissive second locus (e.g., a compensatory, partially redundant, regulatory, or modifier gene) will there be expression of ***calpain*** mutations. Since one would need mutations at both loci to be affected, the disease prevalence would remain low. By analogy,. . .
